1. Derated linearly 0.6 W/°C for T_C > +25 °C
 2. The following formula derives the maximum theoretical I_D limit. I_D is limited by package and internal wires and may also be limited by pin diameter:

$$I_D = \sqrt{\frac{T_J(\max) - T_C}{R_{\theta JC} \times R_{DS(on)} @ T_J(\max)}}$$

3. See [Figure 3](#) for maximum drain current graphs
4. I_{DM} = 4 X I_{D1} as calculated in note (2)

SEE (Single Event Effect) Typical Response:

Heavy Ion testing of the 2N7380 device was completed by similarity of die structure to the 2N7261. The 2N7261 has been characterized at the Texas A&M cyclotron. The following SEE curve has been established using the elements, LET, range, and Total Energy conditions as shown:

FIGURE 2 2N7380 (2N7261)

It should be noted that total energy levels are considered to be a factor in SEE characterization. Comparisons to other datasets should not be based on LET alone. Please consult factory for more information.
