2. Functional Description

The Si53315 is a low jitter, low skew 1:10 differential buffer with an integrated 2:1 input mux and individual OE control. The device has a universal input that accepts most common differential or LVCMOS input signals. A clock select pin is used to select the active input clock. The selected clock input is routed to two independent banks of outputs. Each output bank features control pins to select signal format and LVCMOS drive strength settings. In addition, each clock output has an independent OE pin for individual clock enable/disable.

2.1. Universal, Any-Format Input
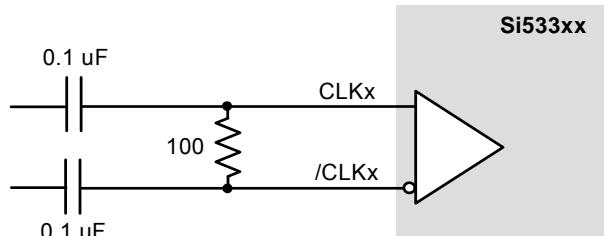

The Si53315 has a universal input stage that enables simple interfacing to a wide variety of clock formats, including LVPECL, LVCMOS, LVDS, HCSL, and CML. Tables 12 and 13 summarize the various input ac- and dc-coupling options supported by the device. Figures 1 and 2 show the recommended input clock termination options.

2.2. Input Bias Resistors

Internal bias resistors ensure a differential output low condition in the event that the clock inputs are not connected. The noninverting input is biased with a 18.75 kΩ pulldown to GND and a 75 kΩ pullup to V_{DD}. The inverting input is biased with a 75 kΩ pullup to V_{DD}.

2.3. Universal, Any-Format Output Buffer

The Si53315 has highly flexible output drivers that support a wide range of clock signal formats, including LVPECL, low power LVPECL, LVDS, CML, HCSL, and LVCMOS. SFOUT[0] and SFOUT[1] are 3-level inputs that can be pin-strapped to select the clock signal formats for all of the outputs, Q0 through Q9. This feature enables the device to be used for format/level translation in addition to clock distribution, minimizing the number of unique buffer part numbers required in a typical application and simplifying design reuse. For EMI reduction applications, four LVCMOS drive strength options are available for each V_{DDO} setting.

2.4. Input Mux and Output Enable Logic

The Si53315 provides two clock inputs for applications that need to select between one of two clock sources. The CLK_SEL pin selects the active clock input. The table below summarizes the input and output clock based on the input mux and output enable pin settings.

2.5. Power Supply (V$_{DD}$ and V$_{DDOX}$)
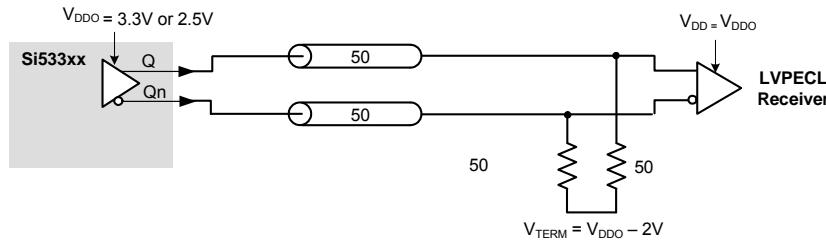

The device includes separate core (V$_{DD}$) and output driver supplies (V$_{DDOX}$). This feature allows the core to operate at a lower voltage than V$_{DDO}$, reducing current consumption in mixed supply applications. The core V$_{DD}$ supports 3.3, 2.5, or 1.8 V. Each output bank has its own V$_{DDOX}$ supply, supporting 3.3, 2.5, or 1.8 V.

Notes:
General
1. All dimensions shown are in millimeters (mm) unless otherwise noted.
2. This Land Pattern Design is based on the IPC-7351 guidelines.

Solder Mask Design
1. All metal pads are to be non-solder mask defined (NSMD). Clearance between the solder mask and the metal pad is to be 60 μm minimum, all the way around the pad.
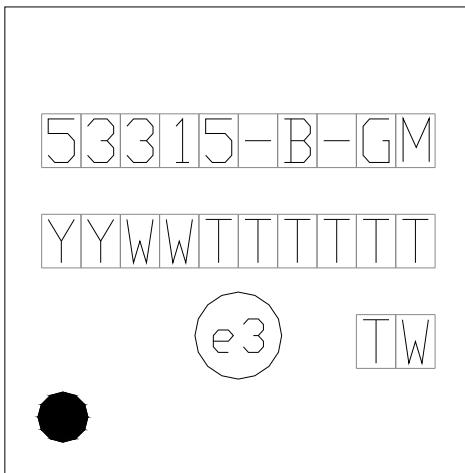

Stencil Design
1. A stainless steel, laser-cut and electro-polished stencil with trapezoidal walls should be used to assure good solder paste release.
2. The stencil thickness should be 0.125 mm (5 mils).
3. The ratio of stencil aperture to land pad size should be 1:1 for all perimeter pads.
4. A 2x2 array of 1.0 mm square openings on 1.45 mm pitch should be used for the center ground pad.

Card Assembly
1. A No-Clean, Type-3 solder paste is recommended.
2. The recommended card reflow profile is per the JEDEC/IPC J-STD-020 specification for Small Body Components.
